Communication

- ▶ Lecture notes for each section will be available the afternoon before you need them
 - ▶ Check AtL frequently for announcements and new information
 - ▶ All info will also be on the course resource page
 - ▶ <http://bio3ss.github.io/>
- ▶ The professor is Jonathan Dushoff
 - ▶ dushoff@mcmaster.ca
 - ▶ Office hours will be announced
 - ▶ Or ask questions on facebook group
 - ▶ Bio 3SS Winter 2018
 - ▶ I am not your friend

Expectations of professor

- ▶ Start and end on time
- ▶ Focus on conceptual understanding
- ▶ Make clear what terminology and facts must be learned
- ▶ Open to questions – both in class (within reason) and at office hours
- ▶ Responsive to questions on class forums (Facebook and AtL)

Expectations of students

- ▶ Start and end on time
- ▶ Don't talk while other students are talking, or while I am responding to student questions
- ▶ If you must talk at other times, be unobtrusive
- ▶ Don't use the internet for non-class activities
- ▶ Attend the lecture, and the mandatory tutorials

Texts

- ▶ The primary text for this course is the lecture notes
- ▶ You will be given readings, which will be posted to ATL
- ▶ You are required to have an Ecology textbook
 - ▶ Molles and Cahill, Second Canadian edition is recommended
 - ▶ If you would like to use a different textbook, let your TA know, so we can attempt to provide readings.

Structure of presentation

- ▶ Required material will be clearly outlined in the notes
 - ▶ * This is an answer: it was omitted from the notes for discussion purposes, you should probably write it in
 - ▶ *This is a comment: I omitted from the notes because I thought it wasn't necessary for you to study. If you write it in, make a note to yourself that it's a comment.*
- ▶ Required terminology will be presented in **bold**
- ▶ General ideas and approaches presented in class may also be required; you should take notes on these in your own words

Taking notes

- ▶ You will do best if you take notes
 - ▶ You should know by now what works for you
 - ▶ Or else that you need to keep working on it
- ▶ If a new concept is making sense to you right now, write something that will help you remember
- ▶ If there's something specific I think you all need to write down, I will write it for you (or mark it as an answer)

Polling

- ▶ You can obtain extra credit by responding to in-class polls
 - ▶ Text from your cell phone, or answer on the web
- ▶ Outdated poll!: Why are you taking this class?

Dushoff

- ▶ Loves math
- ▶ Lived in four countries
- ▶ Studies evolution and spread of infectious diseases
 - ▶ HIV, rabies, ebola, influenza, ...
 - ▶ See notes for more info.

Pythagorean triples

Which country?

Which country?

Which country?

Which country?

Ebola research

TAs

- ▶ Morgan Kain
 - ▶ Talks to angels
 - ▶ Walks down the street

- ▶ Michael Li
 - ▶ 23 acquittals
 - ▶ 0 convictions

Students

- ▶ Outdated poll!: What year are you in?
- ▶ Outdated poll!: What kind of career are you aiming for?

Learning goals

- ▶ Ecology and population ecology
- ▶ Quantitative thinking
- ▶ Dynamical modeling

- ▶ Outdated poll!!: What is ecology?
- ▶ My answer
 - ▶ * The study of how organisms interact with each other and with the environment
 - ▶ * Ecology is not environmentalism

- ▶ Outdated poll!!: What is population ecology?
- ▶ My answer
 - ▶ * The study of how organisms interact with each other and with the environment at the population scale
 - ▶ * Larger spatial scale, longer temporal scale
 - ▶ * We use *dynamical models* to link from the individual level to the population level

Dynamical modeling

- ▶ Investigates the links between local, short-term processes, and large-scale, long-term outcomes
- ▶ Allows us to explore what assumptions we're making, and how assumptions affect the link

Measles reports from England and Wales

Math

- ▶ Population ecology uses math
 - ▶ Math is a critical tool for linking processes to outcomes
 - ▶ Math will play a central role in the course
- ▶ We will keep it *simple*
 - ▶ But we understand that simple does not always mean easy
- ▶ Review the math supplement

Humans and abstract thought

- ▶ People are evolved to be concrete thinkers, not conceptual thinkers
- ▶ A goal of this course is to build conceptual thinking skills

value

$$E = mc^2$$

units

$$c^2 = 89,875,517,873,681,800 \text{ m}^2/\text{s}^2$$

J | kg | 299,792,458 m/s

$$c^2 = 89,875,517,873,681,800 \text{ m}^2/\text{s}^2$$

Time scales

Malaria

- ▶ A nasty, mosquito-borne disease
- ▶ In some places (e.g., the southeastern US), it has been eradicated almost by accident
 - ▶ Mosquitoes are still present
- ▶ In other places it persists at high levels despite concerted efforts at elimination
- ▶ *What factors determine when and where malaria spreads?*

Red squirrels

- ▶ Red squirrels are rapidly disappearing from England
 - ▶ Loss of suitable habitat?
 - ▶ Competition from gray squirrels introduced from North America?
 - ▶ Diseases carried by gray squirrels?

Cod fisheries

- ▶ Is the ocean too big for people to affect?
- ▶ What happened to the cod?

Populations

- ▶ Outdated poll!: What population of organisms interests you?

Dandelions

- ▶ Start with one dandelion; it produces 100 seeds, of which only 4% survive to reproduce the next year.
 - ▶ How many dandelions after 3 years?
 - ▶ * 64?
 - ▶ * 125?

Time scales

Dandelions

- ▶ Start with one dandelion; it produces 100 seeds, of which only 4% survive to reproduce the next year.
- ▶ How many dandelions after 3 years?
 - ▶ * 64?
 - ▶ * 125?
 - ▶ See spreadsheet on resource page
- ▶ The spreadsheet is an implementation of a dynamical model!

Dynamical models

- ▶ Make rules about how things change on a small scale
- ▶ Assumptions should be clear enough to allow you to calculate or simulate population-level results
- ▶ Challenging and clarifying assumptions is a key advantage of models

Dandelions

Gypsy moths

Bacteria

Exponential growth

Log and linear scales

Time scales

Gypsy moths

- ▶ A pest species that feeds on deciduous trees
- ▶ Introduced to N. America from Europe 150 years ago
- ▶ Capable of wide-scale defoliation

Gypsy moth fopulations

Moth calculation

- ▶ Researchers studying a gypsy moth population make the following estimates:
 - ▶ The average reproductive female lays 600 eggs
 - ▶ 10% of eggs hatch into larvae
 - ▶ 10% of larvae mature into pupae
 - ▶ 50% of pupae mature into adults
 - ▶ 50% of adults survive to reproduce
 - ▶ All adults die after reproduction
- ▶ Outdated poll!!: What happens if we start with 10 moths?
 - ▶ * We end up with 15 moths
 - ▶ * On average

Moth calculation

- ▶ Researchers studying a gypsy moth population make the following estimates:
 - ▶ The average reproductive female lays 600 eggs
 - ▶ * Assume half are female
 - ▶ 10% of eggs hatch into larvae
 - ▶ 10% of larvae mature into pupae
 - ▶ 50% of pupae mature into adults
 - ▶ 50% of adults survive to reproduce
 - ▶ All adults die after reproduction
- ▶ What happens if we start with 10 moths?
 - ▶ * If 5 are female, we end up with an average of 7.5 moths

Stochastic version

- ▶ Obviously, we will not get *exactly* 7.5 moths.
- ▶ If we consider moths as individuals, we need a **stochastic** model
- ▶ What do we mean by stochastic?
 - ▶ * The model has randomness, to reflect details that we can't measure in advance, or can't predict

Stochastic model

Stochastic model

Stochastic model

Stochastic model

- ▶ A stochastic model has randomness in the model.
- ▶ If we run it again with the same parameters and starting conditions, we get a different answer

Bacteria

Exponential growth

Log and linear scales

Time scales

Bacteria

- ▶ Imagine we have some bacteria growing in a big tank, constantly dividing and dying:
 - ▶ They divide (forming two bacteria from one) at a rate of 0.04/ hr
 - ▶ They wash out of the tank at a rate of 0.02/ hr
 - ▶ They die at a rate of 0.01/ hr
- ▶ Rates are **per capita** (i.e., per individual) and **instantaneous** (they describe what is happening at each moment of time)
- ▶ We start with 10 bacteria/ml
 - ▶ How many do we have after 1 hr?
 - ▶ What about after 1 day?

Bacteria in a tank

Bacteria, rescaled

- ▶ Imagine we have some bacteria growing in a big tank:
 - ▶ They divide (forming two bacteria from one) at a rate of 0.96/day
 - ▶ They wash out of the tank at a rate of 0.48/day
 - ▶ They die at a rate of 0.24/day
- ▶ If we start with 10 bacteria/ml, how many do we have after 1 day?

Units

- ▶ When we attach units to a quantity, the meaning is concrete
 - ▶ $0.24/\text{day}$ *must* mean exactly the same thing as $0.01/\text{hr}$
 - ▶ The two questions above *must* have the same answer

Bacterostasis

- ▶ What if we add an agent to the tank that makes the birth and death rates nearly zero?
- ▶ Now the bacteria are merely washing out at the rate of 0.02/hr
- ▶ If we start with 10 bacteria/ml, how many do we have after:
 - ▶ Outdated poll!: 1 hr?
 - ▶ Outdated poll!: 1 wk?

Exponential growth

- ▶ What is exponential growth?
- ▶ Which of these is an example?

A

B

C

D

Exponential growth

- ▶ Outdated poll!: What is exponential growth?
- ▶ Outdated poll!: Which of these is an example?

A

B

C

D

A

A on the log scale

C

C on the linear scale

Types of growth

- ▶ arithmetic/linear:
 - ▶ * *Add a fixed amount in a given time interval*
 - ▶ * *Total growth rate is constant*
- ▶ geometric/exponential:
 - ▶ * *Multiply by a fixed amount in a given time interval*
 - ▶ * *Per-capita growth is constant*
 - ▶ * *Only C is exponential, mathematically speaking.*
- ▶ other:
 - ▶ Many possibilities, we may discuss some later

Exponential decline?

- ▶ Outdated poll!!: What does exponential decline look like?
 - ▶ * Decline is proportional to size
 - ▶ * Declines more and more *slowly* (on linear scale)

Exponential decline

- ▶ Decline is proportional to size
- ▶ Declines more and more slowly (on linear scale)

Terminology

- ▶ Sometimes people distinguish
 - ▶ **arithmetic** from **linear** growth, or
 - ▶ **geometric** from **exponential** growth
- ▶ Based on:
 - ▶ * **discrete** vs. **continuous** time
- ▶ We won't worry much about this.

Predation comparison

Predation comparison

- ▶ A 300 lb lion is attacking a 600 lb buffalo!
- ▶ Outdated poll!: This is analogous to a 15 lb red fox attacking:
 - ▶ A 30 lb beaver (twice as heavy)?
 - ▶ A 315 lb elk (500 lbs heavier)?

Different scales

- ▶ The log scale and linear scale provide different ways of looking at the same data
- ▶ Equally valid
- ▶ What are some advantages of each?

Advantages of arithmetic view

- ▶ * When there is no natural zero (or the natural zero is irrelevant)
 - ▶ * Often the case for time or geography
- ▶ * When zeroes (or negative numbers) can occur
- ▶ * When we are interested in adding things up

Advantages of geometric view

- ▶ * When comparing physical quantities, or quantities with natural units
- ▶ * When comparing proportionally

Gypsy-moth example

Scales in population biology

- ▶ The linear scale looks at differences at the population scale
- ▶ The log scale looks at differences at the individual scale (per capita)

Bacteria

Exponential growth

Log and linear scales

Time scales

Speeding in Taiwan

- ▶ A life experience
- ▶ Some clarifications
 - ▶ I was reading the sign wrong
 - ▶ I didn't actually know how to say speed
 - ▶ The whole thing never happened

Speeding in Taiwan

- ▶ Moral:
 - ▶ Units (km is *not* a speed)
 - ▶ Exponential decay
- ▶ Imagine now that I follow the signs exactly and unrealistically.
- ▶ Outdated poll!: Do I ever arrive in the (ideal) town of Speed?
 - ▶ * No. I am always an hour away!
 - ▶ * But I do get extremely close (after several hours)
- ▶ Does anyone remember Zeno's paradox?
 - ▶ * Don't worry about it, then

Characteristic times

- ▶ If something is declining exponentially, the rate of change (units [widgets/time]) is always proportional to the size of the thing ([widgets]).
- ▶ The constant ratio between the rate of change and the thing that is changing is:
 - ▶ the **characteristic time** (something/change), or
 - ▶ the **rate of exponential decline** (change/something)
- ▶ *I'm always 1 hour away from the town of Speed*

Characteristic times

Characteristic times

Characteristic times

Characteristic times

Bacterostasis

- ▶ What if we add an agent to the tank that makes the birth and death rates nearly zero?
- ▶ Now the bacteria are merely washing out at the rate of 0.02/hr
- ▶ If we start with 10 bacteria/ml, how many do we have after:
 - ▶ Outdated poll!: 1 hr?
 - ▶ Outdated poll!: 1 wk?

Bacteriostasis answers

- ▶ Bacteria wash out at the rate of 0.02/hr
 - ▶ * This can only make sense with concrete units if we think of it as an instantaneous rate – more soon
 - ▶ * $N = N_0 \exp(-rt)$
- ▶ Start with 10 bacteria/ml:
 - ▶ * After one hour, 9.802 bacteria/ml
 - ▶ * After one week, 0.347 bacteria/ml

Bacteriostasis analysis

- ▶ Rate of exponential decline is $r = 0.02/\text{hr}$
- ▶ Characteristic time is $T_c = 1/r = 50\text{ hr}$
- ▶ If experiment time $t \ll T_c$, then proportional decline $\approx t/T_c$
- ▶ The answer makes sense for short times and for long times
- ▶ *We will come back to this*

Characteristic times

Characteristic times

Characteristic times

Characteristic times

Euler's e

- ▶ The reason mathematicians like e is that it makes this link between instantaneous change and long-term behaviour
- ▶ If I drive for an hour, how much closer do I get to the ideal town of Speed?
 - ▶ * e times closer

Euler's e

- ▶ e or $1/e$ is the approximate answer to a lot of questions like this one
 - ▶ If I compound 1%/year interest for 100 years, how much does my money grow?
 - ▶ If two people go deal out two decks of cards simultaneously, what is the probability they will never match cards?
 - ▶ If everyone picks up a backpack at random after a test, what's the probability nobody gets the right backpack?

Exponential growth

- ▶ We can think about exponential growth the same way as exponential decline:
 - ▶ Things are always changing at a rate that would take a fixed amount of time to get (back) to zero
 - ▶ This is the characteristic time
 - ▶ Exponential growth follows $N = N_0 \exp(rt) = N_0 \exp(t/T_c)$

Characteristic times

Bacterial growth

Characteristic times

Bacterial growth

Characteristic times

Bacterial growth

Characteristic times

Bacterial growth

Doubling time

- ▶ Some people prefer to think about doubling times.
- ▶ These make just as much sense as characteristic times, but don't have the direct link to the instantaneous change.
 - ▶ It takes T_c time to increase by a factor of e
 - ▶ It takes $\log_e(2)T_c \approx 0.69 T_c$ to increase by a factor of 2
 - ▶ We can write $T_d = \log_e(2)T_c$
- ▶ You should be able to do this calculation

Bacterial growth

Bacterial growth

Characteristic time and doubling time

Half life

- ▶ The half life plays the same role for exponential decline as the doubling time does for exponential growth:
 - ▶ $T_h = \log_e(2) T_c$
 - ▶ It takes T_c time for a declining population to decrease by a factor of e
 - ▶ It takes $\log_e(2) T_c \approx 0.69 T_c$ to decrease by a factor of 2
 - ▶ We can write $T_h = \log_e(2) T_c$

Bacteriostasis

Bacteriostasis

Characteristic time and half life
